

Breast & Ovarian genetic cancer risk assessment and counseling

Predictive / Preventive Individualized Program

In Clínica's Diagonal Genetics and Genetic Counseling Unit we offer Breast and Ovarian genetic cancer risk assessment and counseling, which is always adjusted to the particular situation of each case (both their personal as well as family health history).

Thus, we offer genetic counseling, not only for cases where the family (inherited) component is evident, but also in those situations where the multifactorial component may be the most probable cause. In this sense, we assess for different genetic variants (genetic polymorphisms) together with non-genetic risk factors, that allow us not only to adjust risks, but also to design a target-focused prevention strategy.

In summary, we offer a risk assessment for breast and ovarian cancer at its **two possible scenarios**:

- ❖ Syndromic or hereditary cancer (hereditary syndromes of family cancer such as, for example, Breast and Ovarian Cancer syndrome due to mutations in BRCA1, BRCA2, ATM, BARD1, BRIP1, CDH1, PETN, PALB2, RAD50-51, STK11 XRCC2 genes).
- ❖ Non-syndromic or sporadic (considering the gene-environment and gene-gene interactions in each particular context).
